

Q1. Explain why publishing and sharing reports is considered more important than just building dashboards in Power BI Desktop.

-> Building dashboards and reports in Power BI Desktop is only the first step. The real value comes when reports are published and shared with stakeholders so they can access insights and make business decisions.

Reasons:

- Enables collaboration among teams.
- Makes reports accessible through the web and mobile devices.
- Allows real-time data refreshes.
- Supports governance and security controls.
- Helps decision-makers access insights without Power BI Desktop.

Q2. Define Power BI Service and explain its role in comparison to Power BI Desktop in the reporting lifecycle.

-> Power BI Desktop

- A development tool used to connect data, transform it, create models, and build reports.

Power BI Service

- A cloud-based SaaS platform used to publish, share, collaborate, refresh, and manage reports and dashboards online.

Role in Reporting Lifecycle

1. Create reports in Power BI Desktop.
2. Publish them to Power BI Service.
3. Share reports with users.
4. Schedule refreshes and manage security.
5. Monitor report usage and collaboration.

Q3. What does publishing a report mean in Power BI? List any two outcomes that occur after a report is published.

-> Publishing a report means uploading a Power BI Desktop (.pbix) report to Power BI Service.

Outcomes:

1. The report becomes available online through Power BI Service.
2. Users can share, collaborate, and create dashboards from the published report.

Other outcomes:

- Scheduled refresh can be configured.
- Security and access permissions can be applied.

Q4. List and explain the steps involved in publishing a report from Power BI Desktop to Power BI Service in the correct sequence.

->

- Create and save the report in Power BI Desktop.
- Sign in to Power BI Desktop using a Power BI account.
- Click Publish from the Home tab.
- Select the target Workspace.
- Confirm publication.
- Wait for upload completion.
- Open Power BI Service.
- Verify that the dataset and report are successfully published.
- Configure sharing, refresh schedules, and security if required.

Q5. Differentiate between Report and Dashboard in Power BI based on structure and usage.

->

Feature	Report	Dashboard
Structure	Multiple pages	Single page
Data Source	Usually one dataset	Can combine multiple datasets
Interactivity	Highly interactive	Limited interaction
Creation Tool	Power BI Desktop	Power BI Service
Usage	Detailed analysis	High-level monitoring
Navigation	Multiple report pages	Single consolidated view

Q6. Explain the difference between the following three sharing methods in Power BI Service: Direct Report Sharing Workspace Access Power BI Apps Also mention one use case for each.

-> 1. Direct Report Sharing

Description:

Specific users are granted direct access to a report.

Advantages:

- Quick and simple.
- Suitable for small groups.

Use Case:

Sharing a sales report with a sales manager.

2. Workspace Access

Description:

Users receive access to the entire workspace based on assigned roles.

Advantages:

- Supports team collaboration.
- Easier management of multiple reports.

Use Case:

BI development team working together on reports.

3. Power BI Apps

Description:

A packaged collection of reports and dashboards distributed to end users.

Advantages:

- Centralized distribution.
- Controlled updates.
- Better governance.

Use Case:

Providing company-wide financial reports to employees.

Q7. Describe the four workspace roles available in Power BI and explain how access control is managed using these roles.

-> 1. Admin

- Full control over workspace.
- Add/remove users.
- Publish and delete content.
- Manage permissions.

2. Member

- Create, edit, publish, and delete content.
- Collaborate with others.

3. Contributor

- Create and edit reports.
- Cannot manage workspace permissions.

4. Viewer

- Read-only access.
- Can view reports and dashboards.

Access Control

Power BI manages access using Role-Based Access Control (RBAC). Permissions are assigned according to workspace roles, ensuring users only receive the level of access they need.

Q8. Why are Power BI Apps considered more secure and scalable than direct sharing? Explain this from a governance and enterprise usage perspective.

-> Power BI Apps are considered more secure and scalable because they separate content creators from consumers.

Governance Benefits

- Centralized management of reports.
- Standardized report distribution.
- Easier auditing and compliance.

- Reduced risk of accidental permission changes.

Scalability Benefits

- One app can be distributed to thousands of users.
- Updates automatically reach all app users.
- No need to individually manage report permissions.

Enterprise Perspective

In large organizations, Apps ensure consistent reporting while maintaining governance and security standards.

Q9. Explain Row-Level Security (RLS) in Power BI. How does RLS ensure that different users see different data using the same report?

-> Row-Level Security (RLS) restricts data visibility based on the logged-in user's identity.

How it Works

1. Create security roles.
2. Define DAX filters for each role.
3. Assign users to roles in Power BI Service.
4. When users open the report, only permitted rows are displayed.

Example

Region	Sales
North	10000
South	15000
East	12000

- User A assigned to North Role sees only North data.
- User B assigned to South Role sees only South data.

Both use the same report, but data visibility differs according to their role.

Benefits

- Protects sensitive information.
- Supports compliance requirements.
- Eliminates the need to create separate reports.

Q10. Assume an organization shares reports without using Apps, workspace roles, or RLS. Discuss any three risks or issues that may arise related to security, governance, or data misuse, and explain how Power BI best practices help prevent them.

-> Risk 1: Unauthorized Data Access

Without RLS, users may view confidential information they should not access.

Prevention

Implement Row-Level Security and least-privilege access.

Risk 2: Poor Governance

Without workspace roles, anyone may modify reports, causing inconsistencies and accidental errors.

Prevention

Assign Admin, Member, Contributor, and Viewer roles appropriately.

Risk 3: Data Misuse and Version Confusion

Direct sharing can create multiple uncontrolled report copies and outdated versions.

Prevention

Use Power BI Apps for centralized report distribution and version management.

Conclusion

Power BI's best practices—Apps, Workspace Roles, and Row-Level Security (RLS)—help organizations maintain:

- Strong security
- Proper governance
- Controlled access

- Scalable report distribution
- Consistent decision-making across the enterprise

These features ensure reports are shared safely, efficiently, and professionally.
